---

- A method of estimating the value of an unknown quantity using principles of inferential statistics.
- Inferential statistics
  - Population: a set of examples
  - Sample: a proper subset of a population
  - Key fact: a random sample tends to exhibit the same properties as the population from which it is drawn.

Image from Tom Murphy

$$\frac{\textit{circumference}}{\textit{diameter}} = \Pi \quad \textit{area} = \Pi * \textit{radius}^2$$

# Rhind Papyrus

*“And he made a molten sea, ten cubits from the one brim to the other: it was round all about, and his height was five cubits: and a line of thirty cubits did compass it round about.”*

**—1 Kings 7.23**

# Archimedes

---

# Buffon-Laplace

$$A_s = 2 * 2 = 4$$

$$A_c = \pi r^2 = \pi$$

$$\frac{\text{needles in circle}}{\text{needles in square}} = \frac{\text{area of circle}}{\text{area of square}}$$

$$\text{area of circle} = \frac{\text{area of square} * \text{needles in circle}}{\text{needles in square}}$$

$$\text{area of circle} = \frac{4 * \text{needles in circle}}{\text{needles in square}}$$

# Arrows Are More Fun than Needles
